

Current Supply & Demand Report Metadata

Report Category: Current

METADATA

Data Description

Current Supply Demand Report - Presents a reasonable estimate of the Alberta supply & demand status in near real-time.

Current Supply Demand (CSD) Report Help	
Legend	
*	Indicates a net-to-grid asset. The value reported in the MC column represents the asset's gross MW value
^	Indicates that the asset includes energy storage
Last Update	The latest time stamp of the report data updated
Alberta Internal Load	Calculated total Alberta demand based on all telemetered Control Area Net Generation plus Interchange.
Alberta Total Net Generation	Total telemetered Net Generation within the Alberta control Area
Contingency Reserve Required	Based on the WSCC Reserve calculation Methodology - DCR Required is the amount of Contingency reserve that should be obtained on average during the hour
DCR	Dispatched (and Accepted) Contingency Reserve
DCR Generation	Total Dispatched Contingency Reserve obtained from Generation assets
DCR Other	Total Dispatched Contingency Reserve obtained from Non- Generation assets (Interconnections, Load, etc)
DCR Total	The mathematical sum of DCR Generation plus DCR Other
Net Actual Interchange	Control area interchange between Alberta and British Columbia, Saskatchewan and Montana - Defined as Import (-) or Export (+)
Net-To-Grid Generation	<p>Net-To-Grid Generation is calculated as per the definition "net generation the ISO determines is delivered to the grid" in Alberta Reliability Standard BAL-002-WECC-AB-2).</p> <p>Load used to calculate contingency reserves requirements, as per BAL-002-WECC-AB-2, is Net-To-Grid Generation minus Net Actual Interchange. Please see BAL-002-WECC-AB-2 for more information</p>
MC	<p>Maximum Capability. For a generating asset, the maximum quantity (MW) that the generating asset is physically capable of providing under optimal operating conditions for that asset while complying with all applicable ISO rules and terms and conditions of the ISO tariff.</p> <p>Note that the MCs of coal units are net of auxiliary load.</p>
MCR	Maximum Continuous Rating
TNG	Total Net Generation (Gross Generation minus Asset service)

Available Formats

- A unit is listed in the CSD page if it is energized, in commercial operation, and if its size is larger than 5 MW.
- A unit is excluded if it is retired, or is no longer operating.

Available Formats

- HTML

Timing of Updates

This report is updated on every 1 minutes.

Maximum Capability. For a generating asset, the maximum quantity (MW) that the generating asset is physically capable of providing under optimal operating conditions for that asset while complying with all applicable ISO rules and terms and conditions of the ISO tariff.

Note that the MCs of coal assets are net of auxiliary load.
